

farthest image first: chases the extremes, stacks picks in the big regions

one pick per real region before any second pick; farthest image within the eligible regions

same quota on shuffled, size-matched groups: spreads over the wrong partition

each real region carries equal total weight; representative images, counts may differ

Simulated 2-D descriptors: four regions offer five images, four offer one; dashed rings mark three visually extreme images. Numbers give pick order (budget 8). Illustration only.
